Basic Aviation Technology
NOW 100% ONLINE

Entry Level Course

Basic Aviation Technology (BAT) Certificate Program

There is a saying in science (and education) that goes...

I hear, I forget. I see, I remember. I do, I understand!

There cannot be any meaningful development without public awareness.

Who can attend?

Basic Aviation Technology (BAT) is a professional certificate program offered to:

1. Arts, Commercial and Science students in secondary schools from JSS1 to SSS3.
2. Students that have graduated and taken WASC exams can also participate in our accelerated BAT program during long school break or online anytime.
3. Current employees of Airlines and Aviation business operators.
4. College, Polytechnic and University Students.
5. Businesspeople who are frequent flyers.
6. Educators and people in teaching profession.
7. Adults curious about aviation awareness and education.

Don't let JAMB jam you.

The era of isolation in aviation education is over. Most of aviation technologies in advanced world are utilized outside the airport environment. They can commonly be found at our homes, shops and small- & large-scale industries.

Why wait for JAMB when you can participate in our Pre-Degree program that will give you direct entry into International College of Aeronautics

Aviation education is that branch of general education concerned with communicating knowledge, skills, and attitudes about aviation and its impact upon society. It may be integrated as part of the curriculums for high schools and tertiary institutions.

Aviation is the fastest growing industry in Africa today. There are existing shortages of skilled manpower to service the growing aviation industry. Most companies hire foreign expatriates because the indigenous people don't have the required skills/experiences to take on these jobs.

In Nigeria, there is a tremendous need to expose the public to aviation-related careers and other aviation-related activities. Moreover, there is a pool of people at the bottom of the economic scale who see absolutely no chance of pursuing a professional career in aviation.

For example, The Aircraft Maintenance Engineering has built in skills that our graduates can use to choose alternate technical careers as electricians, welders, carpenters, automobile repairmen, painters, electronics technicians, computer technicians, panel beaters, air-condition & refrigeration servicemen.

The main objectives of the **Basic Aviation Technology** offered by the **International College of Aeronautics** to its students are:

- 1) To bring awareness among students and by extension to local communities, about the major historical events, the market scenario and technological developments in the field of aviation.
- 2) To give students the opportunity to absorb an intense training and hands-on experience that could be their first step toward lifelong careers in aviation or other aviation-related fields.
- 3) To detect students with strong interest in aviation and encourage them in this regard by mentoring those on the rapid developments and opportunities in the field of aviation.
- 4) To educate current employees in aviation field about tools they need to enhance their performances at work and add value to their career at place of employment.

At the completion of this program, the certificate issued can be used for:

A) Direct Entry into the International College of aeronautics. The Basic Aviation Technology certificate serves as the prerequisite certificate training program for direct entry into International College of Aeronautics.

B) The BAT certificate can be used for entry level jobs in the aviation sector or combined with other non-aviation related discipline.

C) Added advantage for employment with your Polytechnics/University certificates

In one month or less, you will be exposed to the following subjects :

- History of Early Aviation
- Aircraft Structure
- Aircraft Aerodynamics
- Aircraft Instruments
- Weather Theory and Observation
- Aircraft Design and Manufacturing
- Aircraft Engines & Systems
- Flight Planning & Navigation
- Basic Electricity
- Aviation Government Agencies
- Airline Operations
- Building Model Airplane
- Aircraft Safety
- Continuous Improvement
